

# **CS 110 Website Production Links**

Department of Computer Science  
Western Connecticut State University

# Session Overview

Links1.ppt this group of slides

1. Linking to other web pages (html files) on the web using http
2. Linking from one web page (html file) in a folder to another web page (html file) in the same folder

Links2.ppt next group of slides

3. Linking from one web page (html file) to another web page (html file) on the same computer but not in the same folder
4. Link from one place in a webpage (html file) to another place in the same file (optional)

# 1. Linking Using http

Link to a website's homepage using http:

```
<a href="http://www.wcsu.edu">WCSU </a>
```

There are two parts to a link, first is the destination site (<http://www.wcsu.edu>) and the second is text for the link, that you click on (WCSU). When linking to another site on the web, the `http://` is necessary in the href.

## 2. Linking to a Webpage in Same Folder

Link to another webpage(html file) in the same folder and on the same computer:

Download the two html files one.html and two.html, and save them in the same folder.

The first, one.html, has in its body:

```
<a href="two.html">two</a>
```

The second, two.html, has in its body:

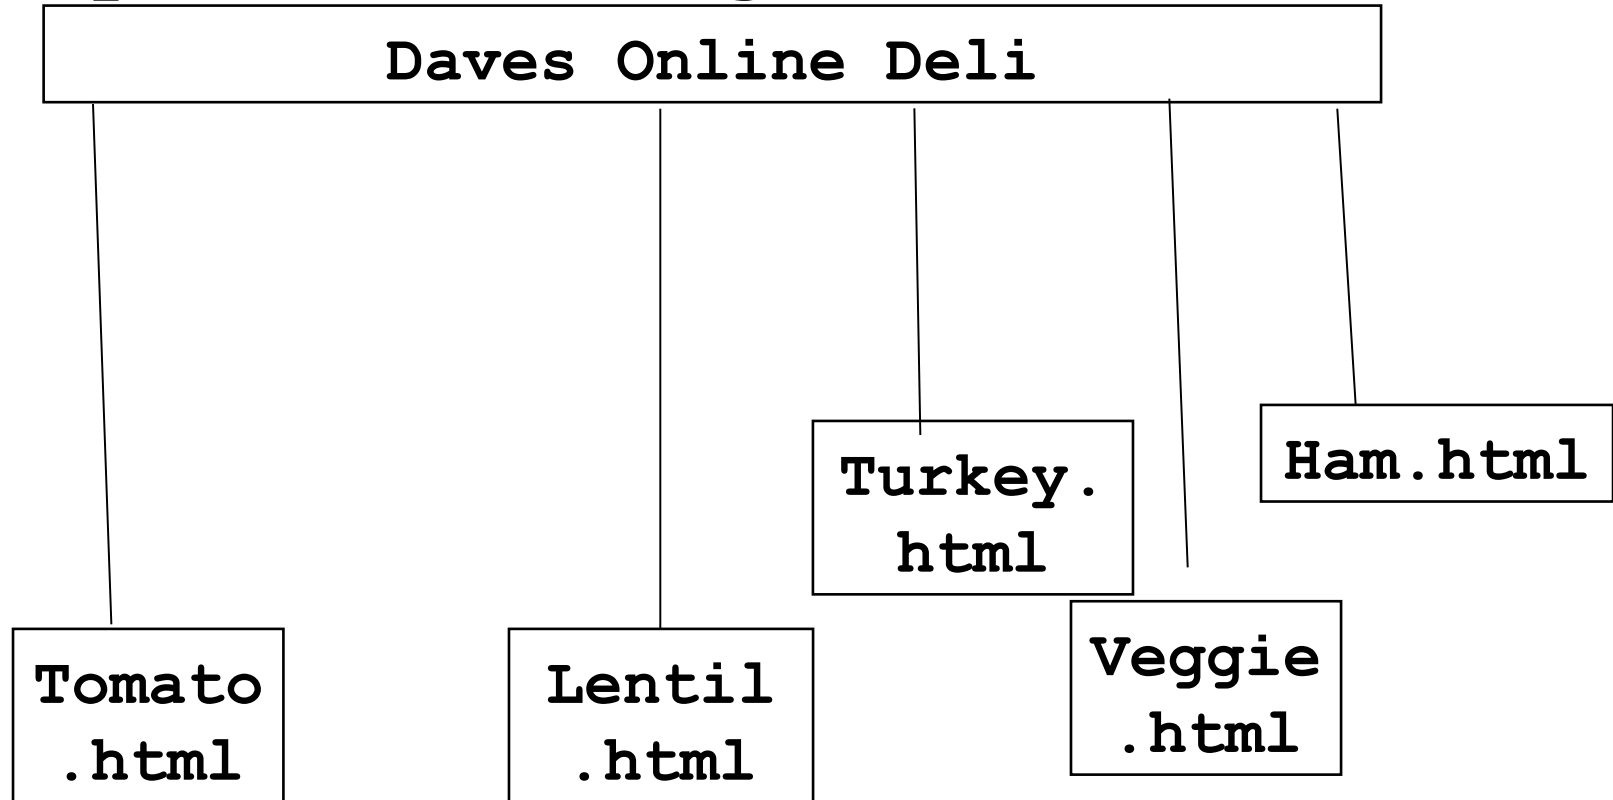

```
<a href="one.html">one</a>
```

So each file links to the other

# **Linking Back and Forth Between Two Files in the Same Folder**

The two webpages, one.html and two.html link to each other. Open one of them in a browser and then click on the link and you'll get the other one open in the browser. Click on this second link and you'll open the first page again.

# A Diagram Show Links in a Website Made Up of Linked Pages in One Folder

# Organizing a Web Site

- Example: **Daves Online Deli.html** is the home page for this website

Create a folder DD and put the downloaded files Daves Online Deli.html and ham.html into it.

Open Daves Online Deli.html in a browser and check out the links. Veggie doesn't work because there is no html file with a webpage in it, named veggie.html in the folder with the other files. The files in your folder constitute a website.

The diagram shows how the files are linked together. All of the html files are in the same folder.
